

STOP THE HEAT AT THE GLASS.

Internal blinds shade a room that has already heated up. NSS Luna mounts on the *outside* of your windows, so most of the sun is stopped before it can become indoor heat.

100 mm

SMALLEST PELMET

The smallest pelmet box available, powder-coated from a range that includes Colorbond®.

2.7 × 2.7 m

MADE FOR WINDOWS

Maximum size per blind, in one clean sheet with no joins in the fabric.

100%

BLOCKOUT OPTION

Maximum darkness and daytime privacy when you want it, or woven mesh to keep the view.

Why outside the glass changes everything

Sunlight becomes heat the moment it passes through glass. An internal blind sits behind that glass – the heat is already in the room, and the pocket of air between blind and window turns into a warm-air trap that radiates back at you all afternoon.

NSS Luna sits in front of the glass. Most of that solar radiation is intercepted at the window face and vented to open air, before it can convert into indoor heat. On Perth's west- and north-facing windows, that difference is what decides the room.

"Shading glass is the best way to reduce unwanted heat gain, as unprotected glass is often the greatest source of heat entering a home."

Quoted from YourHome – Shading, the Australian Government's guide to sustainable homes, which lists external blinds among its recommended shading devices. It also reports that up to 87% of a home's heat is gained through windows, and that effective shading can block up to 90% of the heat from direct sun. General figures for shading, not measurements of any Nu Style Shutters product.

IDEAL FOR

West-facing bedrooms

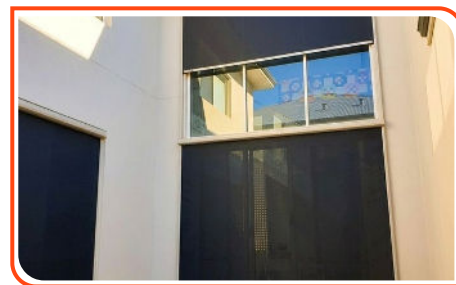

Street-facing windows

Upper-storey rooms

Home offices & media rooms

Courtyards & light wells

Nurseries

COURTYARD WINDOWS

UPPER-STOREY WINDOWS
